

TRELLIS · CLOUD INFRASTRUCTURE THAT GROWS WITHIN A SHAPE

Declare what you want. Trellis builds and tends it.

*A self-hosted platform: you declare a posture, a planner proves a plan, and a reconciler keeps it true —
with no magic.*

A trellis, for the cloud.

You build a structure with a deliberate shape, train living things up it, set rules about what grows where — then tend it continuously, never letting growth escape the shape you set.

- **Shape** you govern — accounts, regions, networks, trust boundaries.
- **Life** that grows within it — your services, owned by your teams.
- **A gardener that never sleeps** — it reconciles, heals, and proves every move.

THE SHAPE OF IT

Posture in. Proven infrastructure out. Forever.

KEY INSIGHT

You declare intent; the planner compiles it and shows its work; the reconciler holds reality equal to it, continuously.

Four dials — and one preset, Criticality.

Intent

What the environment is *for* — a public payments API, a data lake, a sandbox.

Resilience

How it must survive and change — active-active, RPO/RTO, deployment style.

Budget

What it may cost — a ceiling to respect, or the thing to minimize.

Governance

What is *allowed* — services, permissions, compliance, data residency.

No magic: the plan is a proof.

Trellis never "figures it out" behind a curtain. Every action it proposes traces to your objective or a named constraint — and a human approves the proof before anything changes.

- "Two regions, because RTO must be under fifteen minutes."
- "This instance mix, because it is the cheapest that meets it."
- Same inputs, same plan — deterministic, reviewable, signed.

SELF-HEALING

Approve once. It holds the line.

**KEY INSIGHT**

A node dies at 3 a.m. and is healed within the envelope you already approved — no page, no console, no surprise.

Safe by construction.

Least privilege

Approval mints a credential scoped to that one change; it expires the moment apply is done.

One brain, many hands

The planner holds no write rights; narrow actuators do the work, and the reconciler alone stands.

Break-glass

Emergencies get a time-boxed, dual-controlled override — loud, logged, and repaid afterward.

A change is a path, not a target.

Moving a live system is never "redefine and pray." Trellis plans the *route* — and keeps your invariants true at every step, not just at the end.

- Expand-contract, blue-green, canary, rolling — the pattern is chosen by criticality.
- Every step reversible; data is migrated, never dropped.

THE MACHINERY

One brain. Many hands. Nothing trusted by default.

Most of it is proven. One part is the bet.

The proven core

A reconcile loop, GitOps, and least-privilege execution — patterns already proven in practice, assembled with unusual rigor.

The one bet

The planner that turns *what you want* into *how* — the genuine research risk, shipped first as vetted blueprints, never a black box.

What v1 is — and isn't.

- ✓ One cloud, implemented richly (AWS first)
- ✓ Blueprints plus constraint validation, with bounded tuning
- ✓ Reconcile, self-heal, transitions, break-glass
- Global topology optimization — authored and validated, not solved
- Multi-cloud and edge — deferred by design

THE FULL SPECIFICATION, RED-TEAM, AND BRAND
ARE IN THIS BUNDLE.

**Build the shape. Let it
grow.**
